Model 1: Independent sets

Definition 1. An independent set in an undirected graph $G = (V, E)$ is a subset of vertices $S \subseteq V$ such that no two vertices in $S$ are adjacent.

Definition 2. A vertex cover in an undirected graph $G = (V, E)$ is a subset of vertices $C \subseteq V$ such that every edge $e \in E$ has at least one endpoint in (is “covered by”) $C$.

1. Which of the following are independent sets?
   (a) $\{1, 2\}$
   (b) $\{1, 5\}$
   (c) $\{c, a\}$
   (d) $\{e, a, i, g\}$
   (e) $\{7\}$
   (f) $\emptyset$

2. For each graph, list at least three other examples of independent sets.

3. Given an arbitrary graph $G$, does $G$ always have at least one independent set? Why or why not?
4 Intuitively, which is harder: to find big independent sets, or small ones? Why?

5 Based on the previous observation, an interesting question to ask about a given graph \( G \) is to find the _________________.

6 Try to answer your interesting question for the given example graphs (but don’t spend more than a few minutes). How sure are you about your answer?

7 Describe a brute-force algorithm to answer this question. What is its big-\( \Theta \) running time in terms of \(|V|\) and \(|E|\)?

8 Guess the running time (in terms of \(|V|\) and \(|E|\)) of the fastest known algorithm to solve this problem. (You do not have to come up with an algorithm; just guess how fast you think this problem can be solved.)

9 Which of the following are vertex covers?
   
   (a) \{3, 4, 5, 6, 7\}
   (b) \{2, 3, 4, 6, 7\}
   (c) \{b, d, c, f, g, h, i, j\}
   (d) \{b, c, d, f, h, j\}
   (e) \{1, 2, 3, 4, 5, 6\}
   (f) \{1, 2, 3, 4, 5, 6, 7\}

10 For each graph, list at least three other examples of vertex covers.
11 Given an arbitrary graph $G$, does $G$ always have at least one vertex cover? Why or why not?

12 Intuitively, which is harder: to find small vertex covers, or big ones? Why?

13 Based on the previous observation, an interesting question to ask about a given graph $G$ is to find the _________________.

14 Answer your interesting question for the given example graphs. How sure are you about your answer?

15 Describe a brute-force algorithm to answer this question. What is its big-$\Theta$ running time in terms of $|V|$ and $|E|$?

16 Compare your answers to questions 1 and 9. What do you notice?

Make a conjecture based on your observations in the previous section:

**Theorem 3.** Let $G = (V, E)$ be an undirected graph, and $S \subseteq V$ a subset of its vertices. Then $S$ is an independent set if and only if _______________.

Let’s prove it!

Proof. $(\implies)$ Let $S$ be an independent set. We must show

____________________. So pick an arbitrary edge $e = (u, v) \in E$;

by definition we must show that at least one of $u$ or $v$ __________,

that is, at least one of $u$ or $v$ is not ____________________________.
Since $S$ is an independent set and $u$ and $v$ are connected by an

eedge, $u$ and $v$ can’t both ____________________________,

and therefore ____________________________.

$(\impliedby)$ (You fill in the proof for this direction!)

Write down what you get to assume and what you are trying to prove, and expand definitions.
